• AND (&&): Returns true only if both conditions are true 32.

• OR (||): Returns true if at least one condition is true 32.

• NOT (!): Reverses the Boolean result 32 33.

4. Ternary (Conditional) Operator: A shorthand for if-else 34. Syntax: condition ? expression1 : expression2 34 35.

III. Control Flow (Decisions and Iteration)

Control Flow determines the order in which program instructions are executed, allowing a program to "make decisions" instead of running sequentially 36.

A. Conditional Statements

These statements direct the program based on specified conditions 37:

• if: Executes a code block if the condition is true 38.

• if-else: Executes one block if true, and an alternate block if false 39.

• if-else if-else Ladder: Checks multiple conditions sequentially, stopping at the first one that is true 40. This is preferred for handling range-based conditions (e.g., grading scales) 30.

• Nested if: Placing an if inside another if or else block, used for dependent conditions (e.g., checking eligibility where two requirements must pass 41).

• switch: Used when checking a single expression against multiple fixed, discrete values 30

A developer writes the following code within the same function scope:

javascript

```
let user = "Alice";
```

```
let user = "Bob";
```

What is the expected outcome when this code is executed?

A. A new, separate variable named `user` will be created.

B. The variable `user` will be updated to "Bob".
